lifestyle choices.**

Oliver Yerbury-Hodgson results report

Your health check

Date: 21/03/2025

Customer order number: B3291085

Package: Vitality In-Clinic Health Check

Membership number: 03371909

Your clinical team

Certified Healthcare Professional: Tracey Chandler

Laboratory Analysis: N/A

Cardiac Analysis: Express Diagnostics (ISO 9001:2000 accredited cardiology team)

Chief Medical Officer (CMO): Dr Martin Thornton BSc(Hons), MB ChB, MD, MRCGP

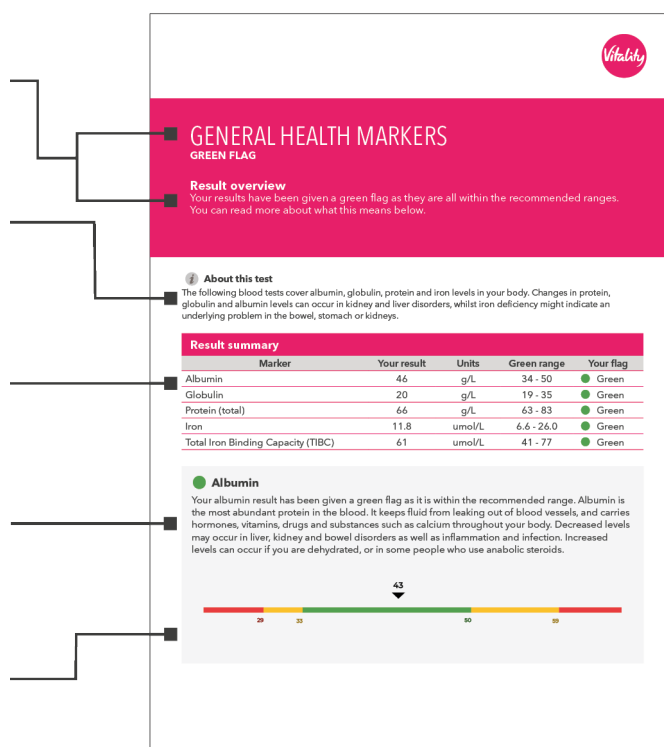

The flag system explained

Each of your results has been given a flag of green, grey, amber or red to help you easily identify any results which are outside of the recommended ranges. The ranges used are based on advice from our laboratory and our CMO, but please note they may vary from those used by your own GP. Our ranges are correct at the time of result generation but are subject to change in line with advances in medical research and practice.

-  A green flag indicates that your result is within the recommended range.
-  A grey flag indicates that a result cannot be determined and is inconclusive or unavailable
-  An amber flag indicates that your result is slightly outside of the recommended range.
-  A red flag indicates that your result is further outside of the recommended range.

Understanding your results

- This section lets you know the overall flag for the individual test result (for example, glucose) or the group of tests (for example, kidney function)
- This section contains information about what the test, or group of tests, is used to detect
- Some results will be presented in a table format, showing your actual result, the flag for that result, and the recommended green range for your reference
- Each result is then explained in detail, giving advice on what to do next
- Some results will be presented with a "slider", to show where your result sits within our recommended ranges

If you see 'unavailable' on any of your result pages, it is nothing to worry about and normally means a sample has been damaged in transit to the laboratory. Please call our Customer Relations team on 0808 168 7867 and we will be able to arrange another appointment free of charge.

BLOOD PRESSURE

GREEN FLAG

Result overview

Your blood pressure result has been given a green flag as it is within the recommended range. You can read more about what this means below.

About this test

As blood flows around your body it exerts pressure on the walls of blood vessels. Your blood pressure varies with each heartbeat between a peak (systolic) and a trough (diastolic) pressure. Blood pressure is one of the most important risk factors for heart attacks and strokes, as high blood pressure leads to an increased risk.

Result summary					Your reading
Marker	Your result	Units	Green range	Your flag	
Systolic	124	mm Hg	90 - 129	 Green	124
Diastolic	75	mm Hg	60 - 85	 Green	75

Blood Pressure

Your blood pressure result has been given a green flag as it's within the recommended range. With every heart beat, the heart contracts and pushes blood through your arteries to the rest of your body. This force creates a wave of pressure on those blood vessels which is referred to as systolic blood pressure. The diastolic blood pressure is the blood pressure in the arteries when the heart muscle relaxes between beats. This is the time when the chambers of the heart fills with blood and takes in oxygen.

Since most people with raised blood pressure do not experience any symptoms, it is important to check your blood pressure from time to time. With this in mind we recommend having your blood pressure checked every year, this is especially important if you have diabetes, heart disease, kidney problems or you have a family history of high blood pressure.

BODY MASS INDEX (BMI)

GREEN FLAG

Result overview

Your body mass index (BMI) result has been given a green flag as it's within the recommended range.

About this test

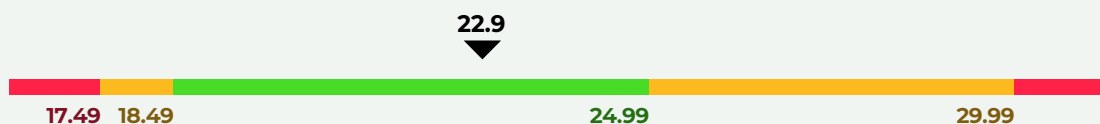

Body Mass Index (BMI) is a measurement that helps assess a person's body weight in relation to their height and is commonly used as a screening tool to classify individuals into different weight categories, such as underweight, normal weight, overweight, or obese. It may not be accurate for certain individuals, such as athletes or those with a high amount of muscle mass. In these cases, further assessments may be needed to evaluate overall health and body composition.

Result summary

Marker	Your result	Units	Green range	Your flag
Body Mass Index (BMI)	22.9	kg/sqm	18.50 - 24.99	 Green

Body Mass Index (BMI)

Your body mass index (BMI) result has been given a green flag as it's within the recommended range. Maintaining a healthy BMI decreases your risk of developing various health conditions, including cardiovascular diseases, diabetes, high blood pressure, dementia, and many types of cancer.

NON-FASTING GLUCOSE

GREEN FLAG

Result overview

Your glucose result has been given a green flag as it is within the recommended range. You can read more about what this means below.

About this test

This blood test measures the amount of glucose (sugar) in the blood. The main purpose of the test is to help identify pre-diabetes or diabetes. In a person without symptoms of diabetes, two separate raised blood glucose results are required before a diagnosis of diabetes can be made. Pre-diabetes refers to blood glucose levels above normal but not high enough to enter the diabetic range. Individuals with pre-diabetes are at high risk of developing diabetes, however steps can be taken to prevent this.

Result summary				
Marker	Your result	Units	Green range	Your flag
Glucose	6.3	mmol/L	3.9 - 6.9	Green

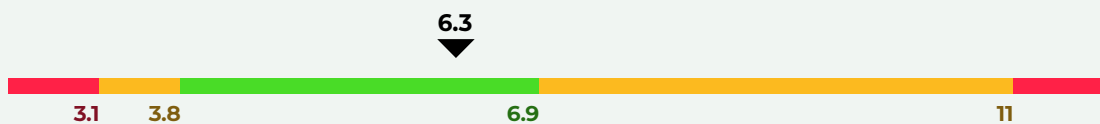

● Glucose

Your non-fasting glucose result has been given a green flag as it's within the recommended range.

To maintain a healthy glucose level we advise that you continue to eat a varied and balanced diet, you take regular exercise, try to avoid eating too many processed carbohydrates like pastries, white pasta, white rice, white bread, sweetened beverages and fruit juices. If you are overweight, you may not be aware that a loss of just 7% of your body weight will lead to a 58% reduction in your risk of developing diabetes over the next 5 years. You should also be mindful of the warning signs of diabetes, which include an increased thirst, frequent urination, blurred vision and feeling more tired than usual.

Your risk of type 2 diabetes is also higher if you are over 40, have a family history of diabetes, are overweight or obese or are of Asian, African-Caribbean or black African origin. If you are in any of the higher risk categories, or are concerned about diabetes, we recommend you maintain a healthy weight for your height and check your blood glucose levels annually.

If you are in any of the higher risk categories, or you are concerned about having diabetes, we would suggest choosing a fasting blood glucose or a (non-fasting) HbA1c test, as these are more sensitive at picking up diabetes and can also identify pre-diabetes. Pre-diabetes refers to blood glucose levels above normal but not high enough to enter the diabetic range.

NON-FASTING LIPID PROFILE

AMBER FLAG

Result overview

Your lipid profile result has been given an amber flag as one or more of your readings is slightly outside of the recommended range. We now suggest you consider a discussion of this with your GP although this is not necessarily a cause for concern, we recommend looking into additional testing of Lipoprotein (a) and/or Heart Health - PLAC to further understand your clinical risk of cardiovascular disease. You can read more about what an Amber flag means below.

About this test

Your non-fasting lipid profile is a panel of five bloods tests which measure the levels of various types of fats in your blood. Cholesterol is essential for the production of healthy cell membranes, hormones and bile acids. However elevated levels are harmful as they increase the risk of cardiovascular diseases (angina, heart attacks, stroke and peripheral vascular disease). Please be aware that people at high risk of cardiovascular disease may have individualised cholesterol targets which are lower than those for the general population.

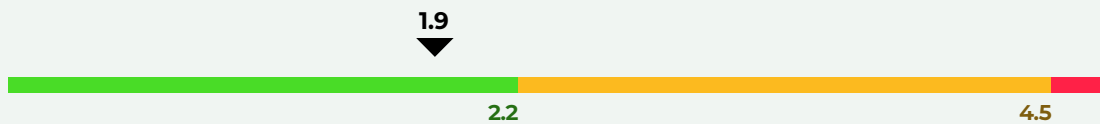

Result summary

Marker	Your result	Units	Green range	Your flag
Triglycerides	1.9	mmol/L	0 - 2.2	 Green
Total Cholesterol	4.4	mmol/L	0 - 4.9	 Green
HDL Cholesterol	0.8	mmol/L	0.9 - 2.3	 Amber
Non-HDL Cholesterol	3.6	mmol/L	0 - 3.8	 Green
Total Cholesterol / HDL ratio	5.6	ratio	0 - 3.9	 Amber

● Triglycerides

Your triglycerides result has been given a green as it is within the recommended range.

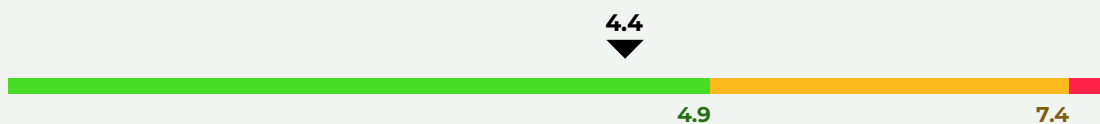

Triglycerides are a type of fat that enter the blood after a meal, where they are either used for energy straight away or stored to be used later. You can keep your triglyceride level healthy by eating a healthy balanced diet (incorporating whole grains and limiting saturated fats), taking regular physical activity, maintaining a healthy body weight for your height, limiting your alcohol consumption to less than 14 units per week and not smoking.

● Total Cholesterol

Your total cholesterol result has been given a green flag as it is within the recommended range.

Total cholesterol is a measurement of all cholesterol (good and bad) that is present in the blood. You can keep your total cholesterol level healthy by eating a healthy balanced diet (incorporating whole grains and limiting saturated fats), taking regular physical activity, maintaining a healthy body weight for your height, limiting your alcohol consumption to less than 14 units per week and not smoking.

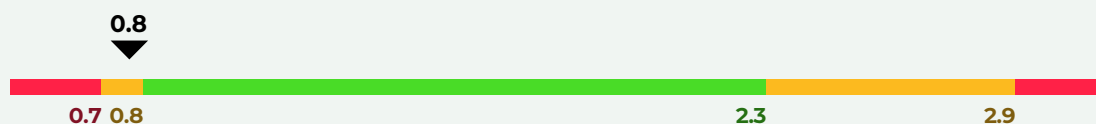

● HDL Cholesterol

Your HDL (high density lipoprotein) cholesterol result has been given an amber flag as it is slightly below the recommended range. HDL cholesterol is known as good cholesterol, as it helps remove excess cholesterol from your blood vessels where it also has an anti-oxidant and anti-inflammatory effect.

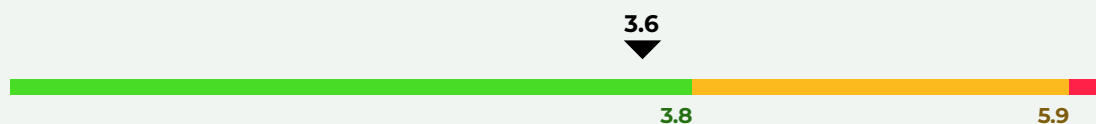

You can improve your HDL Cholesterol level by:

- Cut down on Saturated fats and replace these with unsaturated fats, such as 2 portions of oily fish a week, whole grains, nuts ,avocados and olive oil
- Limit alcohol consumption to less than 14 units per week
- Stop Smoking
- Reduce sedentary periods by increasing your physical activity

● Non-HDL Cholesterol

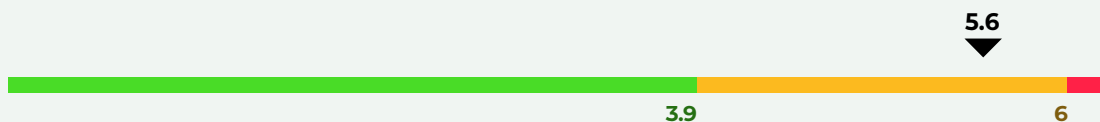

Your Non-HDL Cholesterol (non-high density lipoprotein) cholesterol result has been given a green flag as it is within the recommended range. Non-HDL cholesterol is your total cholesterol minus your HDL cholesterol. It's the way LDL cholesterol (bad cholesterol) is measured in a non-fasting blood test: it's the combined measurement of LDL and all the other types of bad cholesterol. Non-HDL levels should ideally be as low as possible, because high levels contribute to fatty build-ups in the arteries and increase the risk of heart attack, stroke and peripheral arterial disease (PAD). You can keep your Non-HDL level healthy by eating a healthy balanced diet (incorporating whole grains and limiting saturated fats), taking regular physical activity, maintaining a healthy body weight for your height, limiting your alcohol consumption to less than 14 units per week and not smoking.

● Total Cholesterol / HDL ratio

Your total cholesterol/HDL ratio has been given an amber flag as it is slightly above the recommended range. Increased total cholesterol and triglyceride concentrations put you at an increased risk of cardiovascular diseases such as angina, heart attacks, stroke and peripheral vascular disease. The risk is particularly increased if you have a high level of non-HDL cholesterol and a low level of HDL cholesterol. Therefore this ratio is useful way of checking your cholesterol levels are balanced. You can improve your Total Cholesterol/HDL ratio by:

- Cut down on Saturated fats and replace these with unsaturated fats, such as 2 portions of oily fish a week, whole grains, nuts ,avocados and olive oil
- Limit alcohol consumption to less than 14 units per week
- Stop Smoking
- Reduce sedentary periods by increasing your physical activity

Results summary

Below is a comprehensive summary of all your test results, presented in an easily readable format.

If you have any queries or wish to discuss these results with your GP, the summary pages will provide a clear overview for reference.

Blood Pressure					Your reading
Marker	Your result	Units	Green range	Your flag	124
Systolic	124	mm Hg	90 - 129	● Green	75
Diastolic	75	mm Hg	60 - 85	● Green	

Body Mass Index (BMI)				
Marker	Your result	Units	Green range	Your flag
Body Mass Index (BMI)	22.9	kg/sqm	18.50 - 24.99	● Green

Non-Fasting Glucose				
Marker	Your result	Units	Green range	Your flag
Glucose	6.3	mmol/L	3.9 - 6.9	● Green

Non-Fasting Lipid Profile				
Marker	Your result	Units	Green range	Your flag
Triglycerides	1.9	mmol/L	0 - 2.2	● Green
Total Cholesterol	4.4	mmol/L	0 - 4.9	● Green
HDL Cholesterol	0.8	mmol/L	0.9 - 2.3	● Amber
Non-HDL Cholesterol	3.6	mmol/L	0 - 3.8	● Green
Total Cholesterol / HDL ratio	5.6	ratio	0 - 3.9	● Amber
